Structured Traversals for (Multiply) Recursive Algebraic Datatypes

G. Cassian Alexandru

January 10, 2021

Presentation generated from .1hs sources using 1hs2TeX

```
{-# LANGUAGE GADTSyntax #-}
data List a = Nil | Cons a (List a)
data List a where
  Nil :: List a
  Cons :: a \rightarrow (List a) \rightarrow (List a)
main :: IO ()
main = do
  case f of
    Nothing → bar
    Just g \rightarrow baz
  return foo;
```

Algebras

$$F:\mathcal{C}\to\mathcal{C},A,B,A_0\in\mathcal{C}_0$$

Algebra
$$FA$$

$$\downarrow^{\phi}$$
 A

Algebra-Hom:

$$(A, \phi) \rightarrow (B, \psi)$$

 $FA \xrightarrow{Ff} FB$
 $\downarrow \phi$
 $\downarrow \phi$
 $\downarrow \phi$
 $\downarrow \phi$
 $\downarrow \phi$

Initial Algebra:

$$(A, \kappa)$$

$$FA \xrightarrow{Fh} FB$$

$$\kappa^{-1} \downarrow \kappa \qquad \qquad \downarrow \psi$$

Initiality requirement: $h = \kappa^{-1}$; Fh; ψ

As Program

```
newtype Fix f = In \{ \text{ out } :: f (Fix f) \}

type Algebra f c = f c \rightarrow c

cata :: Functor f \Rightarrow Algebra f a \rightarrow Fix f \rightarrow a

cata alg = alg · fmap (cata alg) · out
```
